BAZAAR DECODE
MARKET INTELLIGENCE ANALYSIS REPORT

Consumer Electronics Retail Market: Bajaj Electronics and Croma, Nizampet, Hyderabad

Student Name	**Sarugari Harshavardhan Reddy**
Registration Number	2620560010
Course	BBA · Bazaar Decode · 26BB11V1E
Market ID	CE-01 (as suggested in project file)
Field Visit Date	04 November 2026
Study Area	Nizampet, Hyderabad, Telangana

INDIVIDUAL SUBMISSION

1. Introduction and Objectives

Consumer electronics play an important role in everyday life. Smartphones, televisions, laptops, refrigerators and washing machines are widely used by households and students. Retailers compete not only through product prices but also through brands, product features, discounts, warranties, financing options and after-sales service.

This individual report presents my analysis of the Bazaar Decode study of two organised consumer-electronics retailers in Nizampet, Hyderabad: Bajaj Electronics and Croma. The field visit was conducted on 4 November 2026. The purpose was to understand customer buying behaviour, compare the two retail formats using the figures supplied in the project, identify the market structure and suggest practical improvements.

Objectives

- To identify the main factors influencing consumer-electronics purchases.
- To understand preferences for devices, shopping channels and payment methods.
- To compare the supplied financial and operating estimates for Bajaj Electronics and Croma.
- To examine the market environment through PESTEL analysis and identify relevant stakeholders and regulations.
- To draw findings and recommendations while clearly stating the limitations of the available data.

2. Research Methodology

The project used a combination of field-based observation, a customer-response data file and secondary classroom analysis. The field component covered two stores: Bajaj Electronics at Kakatiya Hills, ALEAP Industrial Area, Nizampet, and Croma at the Ground Floor, E-Block, Eeshwar Villas Road, near Nizampet Main Road, Hyderabad.

The project file records the visit date as 4 November 2026. The field-photo timestamps shown are 2:35 PM for Bajaj Electronics and 2:40 PM for Croma. The project also records that the team approached store management and requested permission to speak with a representative. However, detailed interview notes and the number of owners or managers interviewed were not included in the supplied material.

Data sources and collection

- Field visit: visits to the two named retail outlets and photographs documenting store locations, displays and team interaction.
- Customer-response file: a supplied survey CSV containing 160 rows. The project summary reports the most common response for each survey question.
- Project estimates: store-level financial and operating indicators, explicitly labelled in the source as hypothetical estimates for one store.
- Contextual analysis: PESTEL, stakeholder mapping and market-structure classification based on the project material.

Analysis method

The reported survey counts were converted into percentages using the stated base of 160 records. The two stores were compared using the supplied estimates for revenue, costs, margins, inventory, conversion, average transaction value, footfall, return on investment and break-even revenue. The report uses descriptive comparison rather than statistical testing because respondent-level validated data and actual store accounts were not available.

Important data-quality note

The source file states that the survey CSV contains 160 rows but only 3 unique answer patterns. Therefore, the 160 rows cannot safely be described as 160 independently verified individual respondents. The percentages in this report reproduce the counts supplied in the project; they describe the recorded file and should not be treated

as representative of all customers. The source also has an inconsistency between the planned minimum of 20 customers and the reported 160 survey records. The actual number of distinct people could not be confirmed.

3. Market Profile and Field Study

The market studied is organised consumer-electronics retail in Nizampet, Hyderabad. The product categories include smartphones, televisions, refrigerators, washing machines, laptops and computers, and other electronic products.

Store	Location recorded in project	Visit timestamp
Bajaj Electronics	Kakatiya Hills, ALEAP Industrial Area, Nizampet, Hyderabad	4 Nov 2026, 2:35 PM
Croma	Ground Floor, E-Block, Eeshwar Villas Road, near Nizampet Main Road, Hyderabad 500090	4 Nov 2026, 2:40 PM

The supplied report includes photographs of store exteriors, product displays and team interaction. It does not provide a complete, verified store-wise observation log. Specific shelf prices, customer counts by time slot, queue lengths and product-level sales quantities were not supplied. For that reason, this report does not claim that one store had more observed customers during the visit.

4. Customer Survey Results and Interpretation

The following results reproduce the most common responses and counts stated in the supplied project report. Percentages are calculated against 160 recorded rows.

Survey measure	Most common response	Count	Share
Main purchase influence	Price	70 / 160	43.75%
Most-used device	Smartphones	70 / 160	43.75%
Preferred shopping method	Online shopping	70 / 160	43.75%
Preferred payment method	UPI	70 / 160	43.75%
Main brand-loyalty factor	Product quality	70 / 160	43.75%
Main concern	Poor product quality	50 / 160	31.25%
Preferred purchase setting	Physical stores	50 / 160	31.25%
Trigger to try a new brand	Discounts / offers	70 / 160	43.75%

Interpretation

Price is the leading stated purchase influence, which suggests that customers compare prices and look for value before making a purchase. Discounts and offers are also a common trigger for trying a new brand. Retailers should therefore communicate the final price, offer conditions and product specifications clearly.

Product quality is the leading reported factor behind brand loyalty. At the same time, poor product quality appears as a concern in the recorded responses. This makes product authenticity, warranty clarity, returns and after-sales support important parts of the customer experience.

Smartphones are the most frequently reported device. Online shopping and UPI are the leading reported shopping and payment preferences. However, physical stores are also preferred by a portion of the recorded responses. This indicates that digital convenience and in-store product demonstrations can complement each other.

5. PESTEL Analysis

Factor	Relevance to the consumer-electronics market
Political	Government support for digital infrastructure and domestic electronics manufacturing can support the sector. The project did not measure the effect of any particular scheme on the two stores.
Economic	Price is the leading reported purchase influence (70/160; 43.75%). Price sensitivity, household budgets, inflation and promotional offers can affect demand.
Social	Smartphones are the most frequently used device in the supplied responses (70/160; 43.75%). Consumer expectations change with lifestyle, work, education and entertainment needs.
Technological	Online shopping and UPI are leading preferences (70/160; 43.75% each). Retailers need reliable digital catalogues, payment systems and online-to-store support.
Environmental	The project reports that 70/160 (43.75%) would definitely pay more for an eco-friendly product. E-waste handling practices at either store were not assessed.
Legal	Relevant areas include GST invoicing, consumer protection and warranty disclosures, Legal Metrology declarations where applicable, and E-Waste Management Rules. Compliance at the two stores was not verified.

Overall, the PESTEL analysis indicates that retailers must respond to price-conscious customers while keeping pace with digital shopping and payment habits. Environmental interest is present in the supplied survey, but the project does not provide enough information to assess actual recycling or e-waste practices.

6. Stakeholders and Regulatory Context

The key stakeholders identified in the project include customers, store owners and management, sales employees, service technicians, manufacturers and brands, distributors, suppliers, delivery partners, competing retailers and government regulators.

Customers are directly affected by price, product quality, warranty terms, delivery and service. Store management is responsible for product availability, staff, billing and customer experience. Manufacturers and distributors influence product supply, pricing support and warranty arrangements. Regulators establish requirements related to taxation, consumer rights, packaged-product declarations and e-waste.

The project lists GST registration and tax invoices, consumer-protection and warranty disclosures, E-Waste (Management) Rules and Legal Metrology declarations as relevant requirements. The supplied material marks compliance as 'not verified'. Therefore, this report identifies these as relevant rules but does not claim that either retailer was found compliant or non-compliant.

7. Financial and Operating Comparison

All store financial figures below are hypothetical estimates for one store, as expressly stated in the source project. They are not verified accounts, audited figures or official disclosures of either company.

Monthly measure	Bajaj Electronics	Croma
Revenue	₹2.50 crore	₹3.00 crore
Cost of goods sold	₹2.10 crore	₹2.52 crore
Gross profit	₹40 lakh	₹48 lakh

Operating expenses	₹23 lakh	₹28.5 lakh
Operating profit	₹17 lakh	₹19.5 lakh
Interest and depreciation	₹5 lakh	₹6 lakh
Net profit	₹12 lakh	₹13.5 lakh
Gross profit margin	16%	16%
Net profit margin	4.8%	4.5%

Croma has the higher estimated monthly revenue and net profit in rupee terms. Bajaj has the higher estimated net profit margin, even though both have the same estimated gross margin. This means that, in the supplied model, Bajaj retains a slightly larger share of revenue as net profit.

Operating indicator	Bajaj Electronics	Croma
Annual sales growth	11%	13%
Inventory holding	42 days	55 days
Customer conversion	32%	27%
Average transaction	₹28,000	₹32,000
Monthly footfall	12,000	14,000
Inventory turnover	8 times	6.6 times
Annual ROI	18%	12%
Product return rate	3.5%	4%
Customer acquisition cost	₹450	₹600

The estimates show Croma leading in annual sales growth, average transaction value and monthly footfall. Bajaj leads in estimated conversion, inventory turnover and annual ROI. Bajaj's shorter inventory holding period may indicate faster movement of stock in the model. These comparisons are indicative only because the underlying figures were not independently verified.

8. Break-even and Risk Analysis

Measure	Bajaj Electronics	Croma
Monthly fixed costs	₹18 lakh	₹23 lakh
Contribution margin	14.3%	13.7%
Break-even revenue	₹1.26 crore	₹1.68 crore

Break-even revenue is the level of sales at which contribution covers fixed costs. The supplied estimates place Bajaj's break-even revenue below Croma's. This suggests that Bajaj's estimated cost structure requires a lower monthly revenue level to cover fixed costs.

The source also presents a scenario in which sales decline by 15%. Under that scenario, estimated remaining contribution after fixed costs is ₹17.25 lakh for Bajaj and ₹11.94 lakh for Croma. This suggests that Bajaj has more room in the stated scenario to absorb a slowdown. These are scenario estimates, not forecasts.

The project provides a separate set of additional estimates, including initial investment of ₹5 crore for Bajaj and ₹7 crore for Croma, monthly electricity costs of ₹2.5 lakh and ₹3 lakh, and promotional budgets of ₹3 lakh and ₹4 lakh respectively. Because the source labels these as estimates and some expense categories differ between tables, they should be treated as indicative rather than reconciled accounting data.

9. Market Structure and Key Findings

The project identifies monopolistic competition as the closest market structure. This is reasonable for a market in which multiple retailers sell differentiated brands and models and compete through prices, discounts, product range, warranties and service. The two visited outlets are examples of retailers in the market, not the complete set of sellers.

Key findings

- Price is the most common stated purchase influence in the supplied survey file (70/160; 43.75%).
- Product quality is the leading reported factor behind brand loyalty (70/160; 43.75%).
- UPI is the leading reported payment preference (70/160; 43.75%).
- The financial estimates show higher revenue and footfall for Croma, while Bajaj has stronger estimated conversion, inventory turnover, net margin and ROI.
- The estimated break-even revenue is lower for Bajaj, and the supplied 15% sales-decline scenario leaves it with a higher remaining contribution.
- The survey file has repeated response patterns, and the store-level financial and operating indicators are not verified. The findings should therefore be treated as preliminary.

10. Recommendations

For consumer-electronics retailers

- Use transparent pricing: display the final payable price, discount conditions, exchange value and financing charges clearly.
- Compete through quality and service: explain product specifications, warranty coverage, installation, repair support and return conditions before purchase.
- Connect online and offline channels: keep online product information accurate and allow customers to compare products online before visiting a store for demonstrations.
- Improve inventory planning: monitor inventory days, stock-outs and slow-moving products to reduce unnecessary holding costs.
- Track customer conversion: record store visits and purchases consistently, then evaluate whether promotions are generating profitable sales.
- Build trust in payments and billing: provide reliable UPI options and clear tax invoices.
- Promote responsible disposal: provide customers with clear information about authorised e-waste collection or take-back options where available.

For improving this research

- Collect fresh responses from distinct customers using a consistent questionnaire and retain a response log without unnecessary personal information.
- Verify the number of unique respondents and remove duplicate submissions before calculating percentages.
- Record store-wise product prices, promotions, stock availability and customer footfall using the same observation periods at both stores.
- Document the number and role of staff or managers interviewed, and preserve factual interview notes with permission.
- Use actual store-level sales and cost records only where permission and reliable documentation are available; otherwise label all estimates clearly.

11. Limitations of the Study

- The survey CSV contains 160 rows but only 3 unique answer patterns. The number of distinct respondents is not established.

- No respondent demographics or validated respondent-level dataset were supplied.
- Store-wise prices, actual sales volumes, actual costs, profits, customer footfall counts by time slot and queue observations were not provided.
- Detailed owner or manager interview notes and the number of people interviewed were not included.
- The project records six field photographs, but does not provide all eight planned geo-tagged photographs. Only some photos include GPS coordinates and timestamps.
- The financial and operating figures are hypothetical estimates and should not be treated as actual company performance.
- Regulatory compliance at either store was not verified.

12. Conclusion

The Bazaar Decode study provides a useful introductory view of consumer-electronics retail in Nizampet. The supplied customer-response pattern highlights price, product quality, online shopping and UPI as important considerations. The financial estimates portray Croma as having higher revenue, footfall and average transaction value, while Bajaj performs better on several estimated efficiency measures, including conversion, inventory turnover, net margin, ROI and break-even revenue.

The most important conclusion is that retailers need to balance competitive pricing with reliable product quality, clear warranties and strong after-sales service. They should also combine digital convenience with in-store assistance. Since the survey contains repeated patterns and the store financial figures are hypothetical, further verified data collection is necessary before making firm claims about customer behaviour or the actual performance of either retailer.

Appendix: Source and Individual Work Note

Primary source: the team-supplied 'Bazaar Decode – Market Intelligence Report: Consumer Electronics – Bajaj Electronics and Croma, Nizampet, Hyderabad' project PDF, including the supplied survey summary and hypothetical store-level estimates.

This individual report has been prepared by reorganising and interpreting the supplied project material for individual submission. It does not add unverified store observations, interview quotations, actual financial accounts or external company data.
